Key Words: Natural products, Heterocycles, Lactams, Asymmetric Synthesis

Abstract

We present a facile and highly stereoselective approach to the indolo[2,3-\(a\)]quinolizine ring system from a readily available, non-racemic chiral template. We demonstrate the potential for application of this methodology to natural product synthesis through conversion of the template to some representative indole alkaloids with high enantiomeric purity in both enantiomeric series.

* Corresponding author. S.M.Allin@lboro.ac.uk
The indolo[2,3-\(\alpha\)]quinolizine ring system 1 is of great interest and significance since this heterocyclic template is found within a plethora of highly bioactive indole alkaloids, including geissoschizine 2, \(^{[1]}\) vellosimine 3\(^{[2]}\) and ajmalicine 4.\(^{[3]}\) The presence of the lactam carbonyl in templates such as 1 would allow for possible further functionalisation \textit{en route} to the natural product targets. Recent approaches to the construction of this heterocyclic target system by other groups have included the diastereoselective vinylogous Mannich reaction,\(^{[4]}\) Bischler-Napieralski reaction,\(^{[5]}\) Fischer indole synthesis\(^{[6]}\) and the asymmetric Pictet-Spengler reaction.\(^{[7]}\)

We have recently developed a new and general approach for the stereoselective synthesis of a range of non-racemic heterocycles that involves the cyclisation of pendent aromatic substituents onto \(N\)-acyliminium intermediates as the key ring-forming step.\(^{[8]}\) Based on our novel approach to the indolizino[8,7-\(b\)]indole ring system,\(^{[8a]}\) we recognised that a suitably substituted bicyclic lactam could act as a precursor in a stereoselective approach to the indolo[2,3-\(\alpha\)]quinolizine ring system.

Our approach to the synthesis of the required bicyclic lactam substrate 5 followed the general method previously used in our group.\(^{[8]}\) The \(\beta\)-amino alcohol derivative of (\(S\))-tryptophan was reacted under Dean-Stark conditions in toluene with an appropriate functionalised substrate for 48 h (Scheme 1). Under these reaction conditions we were able to isolate the expected bicyclic lactam in 69\% yield as a 5:1 mixture of separable diastereoisomers, 5a and 5b.

![Scheme 1](image)

The relative stereochemistry of the major diastereoisomer 5a was determined by single crystal X-ray analysis.\(^{[9]}\) This indole-containing bicyclic lactam is a novel example of the
fused 5,6-ring system favoured by Amat and Bosch,[10] and the relative stereochemistry observed for the major isomer 5a is consistent with results obtained both by these researchers and in our own previous work in other areas.[8b]

In a previous communication we noted briefly that treatment of the initial mixture of diastereoisomers of substrate 5 with TiCl₄ gave the desired indolo[2,3-a]quinolizine target 6 in 54% yield, but with only a poor level of product diastereoselectivity (5:2).[8a] We have since discovered that simply treating the mixture of bicyclic lactam substrate diastereoisomers, 5a and 5b, with 2 M HCl in ethanol at room temperature for 20 hours gives an excellent yield of 95% for the cyclisation reaction, and leads to the formation of the desired indolo[2,3-a]quinolizine product as a single diastereoisomer (Scheme 2).

The relative stereochemistry of the single diastereoisomer 6 was determined by single crystal X-ray analysis (Figure 2)[9] and was found to be as favoured in the TiCl₄ mediated cyclisation reaction that had previously given only a 5:2 ratio of product diastereoisomers.

To highlight the synthetic utility of this methodology in the target synthesis of complex indole alkaloids and their synthetic analogues, we undertook the synthesis of a simple indole alkaloid, (S)-(−)-1,2,3,4,6,7,12,12b-octahydroindolo[2,3-a]quinolizine, 11, the main constituent of Dracontomelum mangiferum B1.[11] In order to access the natural (S)-enantiomer of the target we were required to work with the enantiomer of the template. Hence compound 7 was prepared as a single diastereoisomer from (R)-tryptophan by analogous chemistry to that
described above. Our synthetic route to the natural product 11 from 7 is highlighted in Scheme 3.

Scheme 3. (i) IBX, DMSO, r.t., 24 h (60%); (ii) Et$_3$N, (Boc)$_2$O, DMAP, THF, r.t., 4 h (63%); (iii) NaClO$_2$, NaH$_2$PO$_4$, 1-methyl-1-cyclohexene, CH$_3$CN, t-BuOH, H$_2$O, 0 °C to r.t., 18 h (70%); (iv) (PhSe)$_2$, PBu$_3$, CH$_2$Cl$_2$, 0 °C to r.t., 18 h (66%); (v) n-Bu$_3$SnH, AIBN, toluene, 80 °C, 2 h (98%); (vi) TBAF, THF, Δ, 9 h (63%); (vii) LiAlH$_4$, THF, Δ, 3 h then r.t., 12 h (96%).

Our previous method to remove the hydroxymethyl group from templates such as 7 has involved a rhodium-induced decarbonylation sequence.$^{[8a]}$ Due to the rather long reaction times generally needed for our substrates in this protocol we have now applied an easier approach that relies upon a decarboxylation strategy. Compound 7 was oxidised to the carboxylic acid derivative 8 through the corresponding aldehyde; from 8 we generated the acyl selenide derivative and subsequently performed a tin-mediated deacylation to yield the indolo[2,3-α]quinolizine ring system 9. Deprotection of the indole nitrogen gave known compound (S)-10 in >95% e.e. by comparison of optical rotation data.$^{[12a]}$ Reductive removal of the lactam carbonyl group completed the synthesis of the natural product. Target (S)-(−)-11 was found to have an e.e. of 95% and the same absolute configuration as the natural product by comparison of optical rotation data.$^{[12b]}$
In order to further extend the application of our methodology we chose to pursue the synthesis of deplancheine, 14, an alkaloid isolated from the New Caledonian plant *Alstonia deplanchei*.\[13\] As a consequence of the work of Meyers in 1986 that described an asymmetric approach to deplancheine, the absolute configuration of the natural product was determined to be \(R\).\[13a\]

A successful synthesis of deplancheine would require us to further functionalise the lactam ring of the template. Construction of the requisite ethylidene moiety was achieved through a three-step procedure involving generation of the lithium enolate from \((R)-9\), prepared by analogous chemistry to that described in Scheme 3 but starting from \((S)\)-tryptophan. Subsequent aldol reaction with acetaldehyde, activation of the hydroxyl group by mesylation and finally DBN-induced elimination gave the initial target 12 (Scheme 4). We found that whereas a THF/DCM solvent mixture in the elimination step gave only a 4.7:1 ratio in favour of the desired \(E\)-isomer 12, if the elimination procedure was carried out in THF alone as solvent the \(E\)-regioisomer of the ethylidene product 12 was obtained exclusively.\[14\] TBAF-induced deprotection of the indole nitrogen atom liberated the lactam intermediate 13.\[15\]

![Scheme 4. Asymmetric Synthesis of Deplancheine](image)

(i) LDA, CH\(_3\)CHO, THF, –78 °C to r.t., 24 h; (ii) Et\(_3\)N, MsCl, DCM, –40 °C to r.t., 3 h; (iii) DBN, THF, r.t., 16 h (65% for 3 steps); (iv) TBAF, THF, Δ, 9 h (63%); (v) Me\(_3\)OBF\(_4\), 2,6-di-\(r\)-Bu-Py, DCM, r.t., 21 h; (vi) NaBH\(_4\), MeOH, 0 °C, 0.5 h (77% for 2 steps).
The synthesis of (R)-deplancheine was completed through removal of the lactam carbonyl group as described in Scheme 4 through application of a route described by Martin and co-workers. The desired target, (R)-(+) deplancheine, 14, was obtained with an e.e. of >95% and the same absolute configuration as the natural product by comparison of optical rotation data. An X-ray crystal structure of the product R-14 was obtained and is presented Figure 2.

The crystals were obtained by slow evaporation of a dichloromethane solution of the compound. The asymmetric unit comprises two molecules of 14 and one molecule of water. The water molecule links together three molecules of 14 via strong H-bonds, while the NH on N(27) forms a weak N-H···π interaction to the ring C(22B)-C(26) on a symmetry related molecule.

Figure 2.

To demonstrate the potential synthetic utility of our methodology we have also undertaken an asymmetric synthesis of the enantiomer of deplancheine. Our route mirrors that described in Scheme 4, but uses the (R)-enantiomer of tryptophan as the starting material. The desired target, (S)-(−)-deplancheine (Scheme 4), was isolated with an e.e. of >95% by comparison of optical rotation data.
In summary, we report a facile and highly stereoselective approach to the important indolo[2,3-\(a\)]quinolizine template from readily available non-racemic substrates, and have demonstrated the structural modification of the template to deliver indole alkaloids with high enantiomeric purity in both enantiomeric series. Current work is focused on extending the methodology described in this paper to other, more complex indole alkaloid targets. Our progress will be reported in due course.

**Experimental Section**

**General information**

**Solvents and Reagents**
All solvents where necessary were dried, distilled and stored over 4Å molecular sieves prior to use.

**Chromatographic procedures**
Analytical thin layer chromatography (TLC) was carried out using aluminium-backed plates coated with 0.2mm silica. Plates were visualised under UV light (at 254nm) or by staining with either potassium permanganate solution or PMA (phosphomolybdic acid). Flash column chromatography was carried out using Merck Kieselgel (70-230 Mesh ASTM). Samples were applied as saturated solutions in an appropriate solvent or pre-adsorbed onto the minimum quantity of silica. Hand bellows were used to apply pressure when required at the column.

**Spectra**
IR spectra were recorded in the range from 4000 to 600 cm\(^{-1}\). Solid samples were run as nujol
mull, and liquids as thin films.

Nuclear Magnetic Resonance (NMR) spectra: multiplicities were recorded as broad peaks (br), singlets (s), doublets (d), triplets (t), double doublets (dd) and multiplets (m). All NMR samples were made up in deuterated chloroform with all values quoted in ppm relative to tetramethysilane as internal reference. Coupling constants (J values) are reported in Hertz (Hz). Diastereoisomer ratios were calculated from the integration of suitable peaks in the proton NMR.

**Experimental Procedures**

3-([1H-Indol-3-yl]methyl)hexahydrooxazolo[3,2-a][1,3]pyridin-5-one, 5

(2S)-2-Amino-3-(1H-indol-3-yl)propan-1-ol (3.0 g, 15.8 mmol) and methyl-5-oxopentanoate (2.1 g, 15.8 mmol) were added to toluene (150 ml) and refluxed under Dean-Stark conditions for 48 hours. The mixture was cooled to room temperature and the solvent removed under reduced pressure to yield the target compound. 250 MHz ¹H NMR spectroscopy on the crude product mixture revealed the formation of 5 as a 5:1 mixture of diastereoisomers. These diastereoisomers were purified and separated by flash column chromatography over silica using ethyl acetate as eluent (2.90 g, 69%).

**Major isomer (3S,8aS)-5a** isolated as a yellow solid which was recrystallized from dichloromethane to yield colourless needles; Mp 152-156 °C; [α]D = -39.1 (c = 1.7, CH2Cl2); (Found: C, 71.04; H, 6.69; N, 10.27; C16H18N2O2 requires C, 71.09; H, 6.71; N, 10.36%); νmax(thin film, DCM)/cm⁻¹ 3274 (NH), 1628 (NC=O); δH(400 MHz; CDCl₃) 1.43–1.57 (1H, m), 1.67–1.77 (1H, m), 1.96–2.01 (1H, m), 2.24–2.28 (1H, m), 2.41–2.45 (2H, m), 2.68 (1H, dd, J 16, 8), 3.67–3.76 (2H, m), 4.03 (1H, d, J 8), 4.28–4.33 (1H, m), 4.68 (1H, dd, J 12, 4), 7.03 (1H, d, J 4), 7.05–7.22 (2H, m), 7.36 (1H, d, J 8), 7.82 (1H, d, J 8), 8.24 (1H, br, s); δC(100 MHz; CDCl₃) 17.6 (CH₂), 27.0 (CH₂), 28.4 (CH₂), 31.1 (CH₂), 56.1 (CH), 70.0 (CH₂), 89.0 (CH), 111.1 (CH), 112.6 (C), 119.4 (CH), 119.6 (CH), 122.2 (CH), 122.4 (CH), 127.7

(6S,12bR)-1,2,3,6,7,12b-hexahydro-6-(hydroxymethyl)indolo[2,3-a]quinolizin-4(12H)-one, 6

Compound 5a (3.1 g, 11.5 mmol) was dissolved in absolute ethanol (100 ml) under a nitrogen atmosphere. The resulting solution was acidified to pH 1 by the addition of 2 M HCl in ethanol and the mixture was stirred for a further 20 hours at room temperature. After this time the reaction was quenched by addition of saturated aqueous sodium bicarbonate and extracted with ethyl acetate (3 x 150 ml). The organic fraction was dried over anhydrous magnesium sulphate and the solvent removed by rotary evaporation to yield a light brown solid (2.9 g, 95%). 250 MHz ¹H NMR spectroscopy on the crude product mixture revealed formation of 6 as a single diastereoisomer, which was recrystallised from absolute ethanol to yield the target compound as colourless block-like crystals; Mp 288-290 °C; [α]D = +128.8 (c = 0.50, EtOH) (Found: C, 70.75; H, 6.67; N, 10.28; C16H18N2O2 requires C, 71.09; H, 6.71; N, 10.36%);

(6R,12bS)-12-(tert-butoxycarbonyl)-1,2,3,4,6,7,12,12b-octahydro-4-oxoindolo[2,3-a]quinolizine-6-carboxylic acid, 8
A solution of (6R,12bS)-tert-butyl-6-formyl-4-oxo-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12bH)-carboxylate (2.6 g, 7.1 mmol) in acetonitrile (35.0 ml), tert-butyl alcohol (130.0 ml) and 1-methyl-1-cyclohexene (63.0 ml) was stirred rapidly as it was cooled to 0 °C. A solution of sodium chlorite (80% grade) (6.3 g, 54.7 mmol) and sodium dihydrogen phosphate (6.3 g, 49.7 mmol) in water (130.0 ml) was added dropwise over a period of 10 minutes at 0 °C. The solution was then allowed to stir at room temperature for a further 18 hours. After this time the reaction was partitioned between ethyl acetate (300 ml) and brine (200 ml). The ethyl acetate layer was then washed with 1 M aqueous sodium dithionite solution (100 ml). The organic layer was dried over anhydrous
magnesium sulphate and evaporated to dryness to give the target compound which was purified by flash column chromatography over silica eluting with ethyl acetate yielding a yellow oil (1.9 g, 70%);

Radical Induced Decarboxylation Strategy:

(6R,12bS)-tert-butyl-6-((phenylselanyl)carbonyl)-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12bH)-carboxylate

To a flask containing compound 8 (1.9 g, 4.95 mmol) under nitrogen was added anhydrous dichloromethane (30.0 ml) followed by diphenyldiselenide (2.4 g, 7.5 mmol). The resulting mixture was cooled to 0 °C and tributylphosphine (90% grade) (3.1 ml, 10.1 mmol) was added dropwise. The solution was allowed to warm to room temperature and stirring continued for a further 18 hours at room temperature. Dichloromethane (100 ml) and water (100 ml) were added and the aqueous layer was extracted with a further (100 ml) of dichloromethane. The combined organic fractions were washed with brine (100 ml), dried over anhydrous magnesium sulphate and evaporated to dryness to give the crude product which was purified by flash column chromatography over silica eluting with 8:2 hexane:ethyl acetate, then 3:2 ethyl acetate:hexane giving the title compound as a pale yellow foam (1.72 g, 66%); Mp 75-77 °C; [\alpha]D = −84 (c = 1.0, CH2Cl2); \nu_{\text{max}}\,\text{(thin film, DCM)/cm}^{-1} 1729 (COSePh), 1654 (NC=O); \delta_{\text{H}}(400 \text{ MHz; CDCl}_3) 1.44–1.54 (1H, m, C=CCHC(H)), 1.70 (9H, s, OC(CH3)3), 1.95–2.11 (2H, m, CH2CH2C=O), 2.60–2.68 (1H, m, C=CCHC(H)), 2.60–2.68 (1H, m, CH(H)C=O), 2.78–2.85 (1H, m, CH(H)C=O), 2.87–2.93 (1H, m, C=CCH(H)), 3.47–3.52 (1H, m, C=CCH(H)), 5.56–5.59 (1H, m, NCHCOSePh), 6.15–6.17 (1H, m, ArH), 7.24–7.32 (5H, m, ArH), 7.39–7.40 (2H, m, ArH), 7.43–7.46 (1H, m, ArH), 8.03–8.06 (1H, m, ArH); \delta_{\text{C}}(100 \text{ MHz; CDCl}_3) 19.0 (CH2), 22.4 (CH2), 28.3 (3\times\text{CH3}), 31.1 (CH2), 31.8 (CH2), 54.1 (CH), 59.6 (CH), 84.5 (C), 114.8 (C), 115.7 (CH),
(12bS)-tert-butyl-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12bH)-carboxylate, 9
A three-necked flask fitted with a condenser, glass stopper and a suba seal was flushed with nitrogen. A solution of (6R,12bS)-tert-butyl-6-((phenylselanyl)carbonyl)-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12bH)-carboxylate (1.7 g, 3.2 mmol) in anhydrous toluene (20.0 ml) was added via cannula. The solution was then degassed with nitrogen for 15 minutes before adding tri-n-butyltin hydride (3.5 ml, 13.2 mmol) via syringe. The resulting mixture was heated to 80 °C in an oil bath whereupon azobisisobutyronitrile (0.1 g, 0.6 mmol) was added portionwise over a 2 hour period at 80 °C. After 2 hours stirring at 80 °C the mixture was cooled to room temperature and the solvent removed on the rotary evaporator. The resulting crude oil was adsorbed onto silica and purified by flash column chromatography over silica eluting with hexane followed by 3:1 ethyl acetate:hexane. The target compound was isolated as a colourless oil (1.1 g, 98%); [α]D = −77.3 (c = 1.8, CH2Cl2); νmax(thin film, DCM)/cm−1 1732 (NC=O(O)OtBu), 1644 (NC=O); δ(400 MHz; CDCl3) 1.32–1.42 (1H, m, C=CCHC(H)), 1.67 (9H, s, OC(C3H3)3), 1.79–1.86 (2H, m, CH2CH2C=O), 2.34–2.43 (1H, m, CH(H)C=O), 2.54–2.77 (1H, m, C=CCHCH(H)), 2.54–2.77 (1H, m, CH(H)C=O), 2.54–2.77 (2H, m, CH2CH2N), 2.54–2.77 (1H, m, CH(H)N), 5.05–5.15 (1H, m, CH(H)N), 5.05–5.15 (1H, m, C=CCH), 7.18–7.30 (2H, m, ArH), 7.37 (1H, d, J 8, ArH), 8.06 (1H, d, J 8, ArH); δc(100 MHz; CDCl3) 19.5 (CH2), 21.6 (CH2), 28.1 (3×CH3), 30.2 (CH2), 32.1 (CH2), 38.8 (CH2), 56.0 (CH), 84.1 (C), 115.5 (CH), 118.2 (CH), 118.2 (C), 122.9 (CH), 124.5 (CH), 128.6 (C), 135.2 (C), 136.8 (C), 150.1 (NC(O)OtBu), 169.4 (NC=O); MS (EI) m/z 340 [M+], 13.8% (Found: M+, 340.17884. (12bS)-1,2,3,4,6,7,12,12b-octahydroindolo[2,3-a]quinolizine, 11
Lithium aluminium hydride (0.07 g, 1.68 mmol) was weighed into a pre-dried three necked flask fitted with a condenser under a nitrogen atmosphere. Anhydrous tetrahydrofuran (13.0 ml) was added and the suspension was cooled to 0 °C with an ice bath. Compound 10 (0.07 g, 1.68 mmol) in anhydrous tetrahydrofuran (4.0 ml) was added dropwise to the hydride solution at 0 °C. The resulting mixture was heated under reflux for 3 hours and then stirred at room temperature for a further 12 hours. Ether (5.0 ml) was added and the reaction was quenched by the careful addition of saturated aqueous sodium potassium tartrate solution. The mixture was stirred for another 1 hour before the addition of anhydrous magnesium sulphate prior to filtration through a celite pad. The reaction vessel was washed out with ethyl acetate and filtered through the celite pad. The filtrate was evaporated under reduced pressure to yield the crude product which was adsorbed onto silica and purified by flash column chromatography over silica using ethyl acetate as eluent to give the target compound as a yellow solid (0.09 g, 96%), a small portion of which was recrystallised from dichloromethane to yield yellow plate-like crystals; Mp 146-148 °C (lit.113a Mp 149-150 °C); [α]D = –79.6 (c = 1.0, MeOH) (lit.113a [α]D = –86.5 ± 2 (c = 1.0, MeOH)); νmax(thin film, DCM)/cm⁻¹ 3441 (NH); δd(400 MHz; CDCl3) 1.40–1.52 (1H, m, C=CCH2CH(H)), 1.57 (1H, ddd, J 24, 16, 4, C=CCHCH(H)), 1.69–1.77 (2H, m, C=CCH(CH2)2CH2), 1.85–1.89 (1H, m, C=CCH2CH(H)), 2.02–2.05 (1H, m, C=CCHCH(H)), 2.37

(12bR)-(E)-tert-butyl-3-ethylidene-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12b)-carboxylate, 12

To a stirred solution of diisopropylamine (1.3 ml, 8.8 mmol) in anhydrous tetrahydrofuran (10.0 ml) was added n-butyllithium (2.5 M solution in hexanes) (3.5 ml, 8.8 mmol) dropwise at 0 °C under nitrogen. The reaction mixture was stirred for 15 minutes at 0 °C and then cooled to −78 °C whereupon a solution of (12bR)-tert-butyl-1,2,3,4,6,7-hexahydro-4-oxoindolo[2,3-a]quinolizine-12(12b)-carboxylate R-9 (1.0 g, 2.9 mmol) in anhydrous tetrahydrofuran (15.0 ml) was added via cannula. The resulting mixture was stirred for a further 30 minutes at −78 °C after which time acetaldehyde (1.6 ml, 29.0 mmol) was added dropwise via syringe. The reaction was allowed to warm to room temperature overnight and then quenched by the addition of saturated aqueous ammonium chloride solution (30.0 ml) and extracted with ethyl acetate (2 x 50 ml). The combined organic extracts were dried over anhydrous magnesium sulphate and the solvent was removed under reduced pressure to yield a yellow oil. The crude oil was dissolved in anhydrous dichloromethane (15.0 ml) under a nitrogen atmosphere. Triethylamine (1.2 ml, 8.7 mmol) was added and the mixture cooled to −40 °C before adding methane sulfonyl chloride (0.34 ml, 4.4 mmol). After 20 minutes stirring at −40 °C the reaction was allowed to warm to room temperature and stirred for an additional 3 hours. After this time the solvent was removed and the mesylate dissolved in anhydrous tetrahydrofuran (35.0 ml) to which 1,5-diazabicyclo[4.3.0]non-5-ene (1.1 ml, 8.7 mmol) was added and stirred at room temperature for 16 hours. The solvent was removed and the residue re-dissolved in dichloromethane (80 ml) which was washed with saturated aqueous ammonium chloride solution (60 ml). The organic fraction was dried over anhydrous
magnesium sulphate and evaporated to dryness to give the crude product. 250 MHz 1H NMR spectroscopy of the crude product revealed formation of the product as a single trans geometrical isomer which was purified by flash column chromatography over silica using 5:1 hexane:ethyl acetate as eluent (0.70 g, 65%).

**Trans isomer 12** isolated as a pale yellow oil; [α]D = +140.4 (c = 2.0, CH2Cl2); νmax (thin film, DCM)/cm⁻¹ 1734 (NC=O(O) tBu) 1591 (C=C); δH(400 MHz; CDCl3) 1.47–1.52 (1H, m), 1.70 (9H, s), 1.77 (3H, d, J 8), 2.40–2.49 (1H, m), 2.58–2.64 (1H, m), 2.71–2.72 (1H, m), 2.73–2.76 (2H, m), 2.84–2.90 (1H, m), 5.13–5.23 (2H, m), 7.00–7.05 (1H, m), 7.23–7.32 (2H, m), 7.43–7.46 (1H, m), 8.06–8.08 (1H, m); δC(100 MHz; CDCl3) 15.7 (CH3), 21.5 (CH2), 28.2 (3xCH3), 30.3 (CH2), 39.1 (CH2), 55.1 (CH), 84.2 (C), 115.6 (CH), 118.2 (C), 118.3 (CH), 123.0 (CH), 124.5 (CH), 128.6 (C), 129.3 (C), 134.2 (CH), 135.0 (C), 136.7 (C), 150.2 (NC(O)O‘Bu), 164.9 (NC=O); MS (EI) m/z 366 [M+, 8.9%] (Found: M⁺, 366.19484. [9] See: S. M. Allin, C. I. Thomas, J. E. Allard, M. Duncton, M. R. J. Elsegood, M. Edgar, *Tetrahedron Lett.* **2004**, *45*, 7103-7105. Crystallographic data (excluding structure factors) for structures 5a (R=0.072) and 6 (R=0.031) in this paper have been deposited with the Cambridge Crystallographic Data Centre (CCDC 227217-227218).

[12] a) Compound 10 gave $[\alpha]_D^{20} = -286$ (c = 1, CHCl$_3$). The same compound is quoted as having $[\alpha]_D^{20} = -232$ (c = 1.02, CHCl$_3$) at an e.e. of 96%$^{13a}$; b) Compound 11: $[\alpha]_D^{20} = -79.6$ (c = 1, MeOH); lit.$^{13a}$: $[\alpha]_D^{20} = -84$ (c = 1, MeOH).

[14] The $E$ stereoisomer was found to display a chemical shift of $\delta 7.0-7.05$ ppm for the olefinic proton, whereas the $Z$ stereoisomer displayed the olefinic proton in a more upfield position of $\delta 5.92-5.97$ ppm. This pattern is in line with reports of NMR data of geometrical isomers of similar indolo[2,3-$a$]quinolizidines.[17] Compound 12 was ultimately converted to target 14, for which structural confirmation was obtained by X-ray crystallography, thus confirming the $E$ stereochemistry of both the final product and its precursors.
